AB Oral care comps. comprise a polymer obtained by copolymg. a mixture of comonomers, said mixture comprising: (a) a cationic monomer selected from (ar-vinylbenzyl) trimethylammonium chloride, (dimethylaminopropyl) methacrylamide, [2(methacryloyloxy)ethyl]trimethylammonium chloride, 2-aminoethylmethacrylate hydrochloride and mixts. thereof; and (b) at least one anionic or neutral monomer selected from styrene, mono-2-(methacryloyl)ethyl succinate, vinyl acetate, N, N-dimethylacrylamide, 2-ethylhexylacrylate, vinylphosphonic acid, acrylic acid, 2-acrylamido-2-methyl-1-propanesulfonic acid, N-[tris(hydroxymethyl)methyl] acrylamide, N-vinylpyrrolidone, Bu acrylate, 2-hydroxyethylacrylate, polyethyleneglycol methylethermethacrylate and mixts. thereof, said oral care composition is in the form of any one of a toothpaste, gel, foam, chewing gum, deformable strip or mouthwash and which is suitable for use in the oral cavity. (ar-vinylbenzyl) trimethylammonium chloride-styrene-N-[tris (hydroxymethyl)methyl]acrylamide copolymer was prepared Adsorption of the polymer to hydroxyapatite disks and pig tongue was studied.

AB Oral care composition containing a polymer obtainable by copolymerizing a mixture of comonomers, in which 40 mol% of the mixture of comonomers is constituted by a comonomer, e.g., H₂C:CR(X)nY (where R = H or Me, X = divalent organic linking group, n = 0 or 1, and Y is a carboxylate or phosphonate anion), and in which the balance of the mixture of comonomers is constituted by neutral and/or cationic comonomers; the composition being in the form of any one of a toothpaste, gel, foam, chewing gum, deformable strip or mouthwash and being suitable for use in the oral cavity. (ar-vinylbenzyl)trimethylammonium chloride-styrene-N-[tris(hydroxymethyl)methyl]acrylamide copolymer was prepared Adsorption of the polymer to hydroxyapatite disks and pig tongue was studied.

AB An emulsifier-free water-thinnable microgel prepared by producing a OH- and COOH-group-containing polyacrylate in the presence of ≥1 phosphonic group-containing compound is used in water-thinnable base coats for the automobile industry. Thus, an acrylic dispersion prepared by radical polymerization of a mixture containing styrene, Bu methacrylate, lauryl acrylate,

2-hydroxy ethylacrylate, vinylphosphonic acid and acrylic acid in Bu alc.
2 h at 120°, neutralized with dimethylethanolamine and crosslinked
with melamine resin (Cymel 327) is burned together with polyester- and
polyurethane dispersion (30 min at 140°) to get a base coat for
steel.

AB	Emulsifier-free microgel dispersions are prepared by polymerizing monounsaturated or polyunsaturated hydroxyl- and carboxy-group-containing acrylic and aromatic monomers in the presence of phosphonic acid derivs. (e.g., reaction products of alkylphosphonic acids with epoxides or vinylphosphonic acid) in an aqueous medium with subsequent crosslinking with aminoplast (e.g., melamine resin), and, optionally, emulsion radical polymerization with hydroxyl-containing monomer. The title microgel dispersion is useful for base coat manufacturing in automotive finishes (in composition containing polyurethane and polyester dispersion with Al bronze in water/butyl glycol at pH 8.0-8.3) to enhance a metallic effect and adhesion to polycarbonate.

AB The invention concerns an antiplaque oral composition comprising an aqueous carrier, a bactericidal agent and a water-soluble copolymer (C), said copolymer comprising a backbone (B) derived from an oxyalkylene oligomer or polymer (AO), and several grafts (G) derived from polymerization of: a water soluble ethylenically unsatd. carboxylic, sulfonic acid monomer (A), or one of its water soluble salts; and a water soluble ester monomer (E) of ethylenically unsatd. carboxylic acid; and of a water soluble ethylenically unsatd. phosphonated or phosphated monomer (P); the resp. amts. of monomers (A), (E) and (P) corresponding to 10 to 90 parts of (A)/ 10 to 70 parts of (E)/ 0.1 to 50 parts of (P), for 100 parts of the total of monomers (A), (E) and (P) of the grafts (G), the relative amts. of backbone (B) and of grafts (G) corresponding to a (B)/(G) mass ratio from 10/90 to 80/20; the average mole weight of said copolymer (C) being 50000 to 2000000. A copolymer was prepared by the reaction of acrylic acid, hydroxyethyl acrylate (I), vinyl phosphonic acid (II), Antarox SC138 where the ratio of II:I was 5:9.3. The antiplaque activity of the polymer (absorption of triclosan on the hydroxyapatite disk) was 53%.

AB The title compns. contain a water-soluble copolymer of an unsatd. carboxylic acid, a C1-12 alkyl (meth)acrylate, and a polymerizable photoinitiator and a water-soluble plasticizer having mol. weight ≤ 4000 . The compns. are useful for splicing the ends of rolls of paper, for labels, on tapes for use on packages, etc. An adhesive comprised an acrylic acid-4-(2-acryloyloxyethyl)phenyl 2-hydroxy-2-Pr ketone-Bu acrylate copolymer and polyethylene glycol (mol. weight 400).

AB Polymers useful in saline waters as alkaline earth sulfate and CaCO₃ deposition inhibitors contain 50-99.5% alkenesulfonic acids
CH₂:C(R₁)ZSO₃R₂ [R₁ = H, Ph, alkyl; R₂ = H, alkyl, NH₄, alkali metal or alkaline earth ion; Z = (CH₂)_n (n = 0-4)] and 50-0.5% phosphonic acid derivative

CH₂:CHPO(OR₁)(OR₂) (R₁, R₂ = H, alkyl, NH₄, alkali metal or alkaline earth ion). Persulfate-initiated polymerization of 90 g ethenesulfonic acid and 10 g vinylphosphonic acid in 120 g H₂O at 60° gave a clear, slightly viscous solution of copolymer (I) with weight-average mol. weight 10,000. The min. concentration of I required to inhibit mineral deposit formation (BaSO₄, tube plugging test) was 15 mg/L.

AB Copolymers of ≥1 monoethylenically unsatd. dicarboxylic anhydride containing 4-6 C, ≥1 monoethylenically unsatd. monocarboxylic acid containing 3-10 C, and, in some cases, other monoethylenically unsatd. monomers are prepared as powders by suspension polymerization at 50-180° in a solvent (other than benzene) in which the monomers are soluble and the copolymer is insol. At least one third of the dicarboxylic anhydride is present in the reactor before the polymerization begins, and the remainder is

added during a time period no greater than the time required to add the first two thirds of the monocarboxylic acid to the reactor. A protective colloid is present in the solvent during copolymn. to prevent agglomeration. The copolymers are used as incrustation inhibitors in laundering. Thus, a mixture of m-xylene 460, maleic anhydride (I) 68, and poly(iso-Bu vinyl ether) (K value 60) 1.7 parts was heated to 139°, treated with 36 parts I (at 70°) during 2 h and a mixture of 104 parts acrylic acid and 10.2 parts tert-Bu2O2 during 3 h, refluxed 2 h, and spray dried to give 199 g powdered copolymer [26677-99-6] (K value 19.9, containing 1.37% monomeric I).

AB In the title process, 10-60% unsatd. C4-6 dicarboxylic acid, anhydride, or salt is polymerized continuously with 40-90% unsatd. C3-10 monocarboxylic acid or salt (total acids 20-80% neutralized) and 0-20% comonomer in aqueous medium at 60-150° in a reactor cascade. Thus, adding a solution of maleic anhydride 72.3, acrylic acid 150, and H2O 153.4 parts, a solution of 28.5 parts 30% H2O2 and 56 parts H2O, and a solution of 85 parts NaOH in 225 parts H2O to the 1st of 3 reactors (all at 100°) and 100 parts 50% aqueous acrylic acid to the 2nd gave a 37% solution of copolymer [52255-49-9] with K-value (2% aqueous solution, fully neutralized) 46 and unreacted maleic acid content 0.76%.
